Abstract

A feeding experiment was conducted to investigate the effects of dietary administration of synbiotic with *Bacillus lincheniformis* WS-2 (CGMCC No. 12813) and alginate oligosaccharides (AOS) on the growth, innate immune response, and intestinal microbiota of the sea cucumber *Apostichopus japonicas* and its resistance to *Vibrio* infection. Sea cucumbers were given a control diet (non-supplemented), pro diet (basal diet plus 1×10^9 cfu (g diet)⁻¹ *B. lincheniformis* WS-2), syn diet (basal diet plus 1×10^9 cfu (g diet)⁻¹ *B. lincheniformis* WS-2 and 10 g (kg diet)⁻¹ AOS) or pre diet (basal diet plus 10 g (kg diet)⁻¹ AOS) over a period of 60 days, and the growth performance and various innate immune parameters of the animals were evaluated after 30 and 60 days of feeding. No significant difference in growth performance was observed between the group fed with the syn and the group fed with the pro diet, but both these groups exhibited significant ($P < 0.05$) enhancement in growth performance compared to the control group. At the same time, both syn and pro diets also resulted in the animals having significantly higher levels of amylase, protease and alginate lyase activities compared to the con diet. Individuals fed with the syn or pro diet
