Highlights

A new *M. bovis* lineage is circulating at the Eastern border of Western Europe

• The predominant lineage is associated with increased cases of clinical mastitis

The predominant lineage is not related to the current predominant lineage in

France

**Abstract** 

Mycoplasma bovis is the most frequent etiologic agent of bovine mycoplasmosis. It causes

various diseases in bovines and considerable economic loss due to the lack of effective

treatment or preventive measures such as vaccination. In contrast to the US, where M. bovis-

mastitis has been reported for a long time, M. bovis infections in Switzerland and Austria
