Authors' Contribution: Mohammad-Hossein Biglu participated in developing the study design, doing the statistical analysis and drafting the manuscript. Alireza Farnam provided technical support. Parvaneh Abotalebi participated in data acquisition. Sahar Biglu contributed to statistical analysis and interpretation of data. Mostafa Ghavami revised the manuscript for important intellectual content.

Ethical issues

The local ethics committee ((Research Affairs of Tabriz University of Medical Sciences) approved the study (the approval number is 5/95/5821 dated 07 March 2014).

Funding statement

We declare that that study did not receive any funding from ant organization.

Conflict of interest statement

The authors have declared that no conflict of interest exists.

Abstract

Background: Female Genital Mutilation/Cutting (FGM/C) or female circumcision is the procedure of eliminating some or all part of the external female genitalia. FGM/C is carried out by traditional circumcisers. They usually use cutting tools like a blade or straight-razor. Although FGM/C is well described in African continent and some Arabic countries, but data from Iran are scarce.
