This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

Morbidity and mortality of childhood onset narcolepsy: a controlled national study

- In both age groups, the comorbidities are elevated in several disease groups.
- Endocrine, metabolic, psychiatric, eye and pulmonary diseases were most common.
- Narcolepsy patients often suffered from multiple comorbidities.
