Abstract

A 49-year-old female patient presented with severe, diffuse abdominal pain of acute onset. The CT scan showed a large hematoma in the right upper mesentery and a 7.5 mm aneurysm on a branch artery of the superior mesenteric artery. During the angiogram, contrast media extravasation was noted from the right colic artery with a 10 mm saccular aneurysm. Coil embolization was successfully performed and she had an uneventful clinical course after the embolization.

Key words

superior mesenteric artery, aneurysm
