Title: Amalga-like virus infecting *Antonospora locustae*, a microsporidian pathogen of grasshoppers, plus related viruses associated with other arthropods

Authors: Jesse D. Pyle, Patrick J. Keeling, Max L. Nibert

PII: S0168-1702(16)30843-7
DOI: <http://dx.doi.org/doi:10.1016/j.virusres.2017.02.015>
Reference: VIRUS 97091

To appear in: *Virus Research*

Received date: 21-12-2016
Revised date: 18-2-2017
Accepted date: 21-2-2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The complete sequence of a new amalga-like virus has been determined
- This virus cryptically infects a basal fungus, microsporidian *Antonospora locustae*
- The TSA database has yielded the complete coding sequence of a related new virus
- This virus derives from a basal hexapod, springtail *Tetrodontophora bielanensis*
- A new genus in family *Amalgaviridae* is proposed to accommodate both viruses
