**Abstract:** Paraganglioma (PGL) are rare tumors arising from extraadrenal chromaffin cells and occasionally secrete catecholamines. The patient commonly presents with headache, palpitation, anxiety, diaphoresis and episodic or sustained hypertension. Rarely a patient can present with Raynaud's phenomenon. We present a case of adolescent girl who presented with isolated Raynaud's phenomenon as only manifestation of metastasis of PGL three years after undergoing surgical excision of normetanephrine secreting abdominal PGL.
