This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

A mouse ocular explant model that enables the study of living optic nerve head events after acute and chronic intraocular pressure elevation: focusing on retinal ganglion cell axons and mitochondria

Elizabeth C. Kimball<sup>1</sup>, Mary E. Pease<sup>1</sup>, Matthew R. Steinhart<sup>1</sup>,  
Ericka N. Oglesby<sup>1</sup>, Ian Pitha, Cathy Nguyen<sup>1</sup> and Harry A. Quigley<sup>1</sup>

<sup>1</sup>From the Glaucoma Center of Excellence, Wilmer Ophthalmological Institute,  
Johns Hopkins University, Baltimore, Maryland, USA

This work was supported in part by PHS research grants EY 02120 and EY 01765 (Dr Quigley, and Wilmer Institute Core grant), and by unrestricted support from Saranne and Livingston Kosberg and from William T. Forrester. The funders had no role in study design, data collection and analysis, decision to publish, or preparation of the manuscript.

5812 Words, 6 Tables, 5 Figures

Key words: glaucoma, sclera, mouse, retinal ganglion cell, axons, mitochondria, transport block
