This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Statement of Novelty

This study demonstrates, for the first time, the potential of a novel microporous mineral sorption coupled with microwave-induced degradation treatment as a cost-effective and practical technology for treatment of atrazine-contaminated waters. Cu(II) and Fe(III) in the micropores significantly enhanced the sorption and degradation of atrazine, with the iron-exchanged zeolites exhibiting strong stability and reusability. Testing with 17 natural water samples showed that this technology performed well, and the sorptive removal of atrazine was only compromised by the DOC level. This is an inherently cleaner technology for pollution control, is well suited for the readership of *Journal of Hazardous Materials*.
