This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A mathematical model of dengue virus dynamics in micro-environment during primary dengue infections is proposed.
- The model captures two major functions of T-cells (adaptive immunity) to combat the dengue virus.
- Bifurcation diagrams of steady states are drawn in different parameters planes.
- The cytokine mediated virus clearance plays a vital role in control of dengue virus.
- The antiviral treatment is incorporated for dengue infection in our model.
