Identifying circumstances under which high insecticide dose increases or decreases resistance selection

J.C. Helps , N.D. Paveley , F. van den Bosch

PII: S0022-5193(17)30278-3
DOI: [10.1016/j.jtbi.2017.06.007](https://doi.org/10.1016/j.jtbi.2017.06.007)
Reference: YJTBI 9103

To appear in: *Journal of Theoretical Biology*

Received date: 27 September 2016
Revised date: 19 May 2017
Accepted date: 7 June 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A model is presented that simulates the control of agricultural insect pests
- The model tracks the selection of resistance under different doses of insecticide
- In most plausible scenarios reducing the dose of insecticide reduces selection
