This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and a review of the resulting galley proof before it is published in its final citable form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

12 **Abstract.** Replicative senescence, induced by telomere shortening, exhibits
13 considerable asynchrony and heterogeneity, the origins of which remain unclear.
14 Here, we formally study how telomere shortening mechanisms impact on senes-
15 cence kinetics and define two regimes of senescence, depending on the initial
16 telomere length variance. We provide analytical solutions to the model, high-
17 lighting a non-linear relationship between senescence onset and initial telomere
18 length distribution. This study reveals the complexity of the collective behavior
19 of telomeres as they shorten, leading to senescence heterogeneity.

20 **Keywords:** stochastic model, telomere, telomerase, replicative senescence,
21 yeast
