This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The turning points of two classic SIS epidemic models are investigated completely.
- The susceptible individuals for SIS models are divided into two sub-classes according to the existence of the past infection.
- The dependence of the epidemic characteristics of the two epidemic models on the initial conditions is analyzed.
- The epidemic characteristics of the two models with different incidences are compared.
