A Cellular Automata Model of Bone Formation

Gabrielle K. Van Scoy, Estee L. George, Flora Opoku Asantewaa,
Lucy Kerns, Marnie M. Saunders, Alicia Prieto-Langarica

PII: S0025-5564(17)30063-9
DOI: [10.1016/j.mbs.2017.02.001](https://doi.org/10.1016/j.mbs.2017.02.001)
Reference: MBS 7907

To appear in: *Mathematical Biosciences*

Received date: 8 December 2015
Revised date: 27 January 2017
Accepted date: 2 February 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- In this paper we present the first towards the larger goal to construct biomimetic multi-scale mathematical models to understand the underlying mechanisms, pathways and multicellular interactions that regulate bone remodeling.
 - The team will work to isolate each cell involved in the bone remodeling process in *in vitro* characterizations and experiments to analyze the mechanisms underlying this complex process by using mathematical modeling and statistical tools.
 - As a first step, this manuscript presents the isolation of osteoblasts in an *in vitro* characterization and the accompanying cellular automata model that mimics the behaviour of osteoblastic cells.
- This paper is truly multidisciplinary approach to understanding the bone formation process. The team includes two biomedical engineers, two statisticians and two mathematical modelers. By taking a multidisciplinary approach, we are able to utilize the strengths of three different areas to better understand the dynamics of bone formation.
 - One feature that makes this paper unique is the use of statistical methods to validate the cellular automata model.
 - The use of statistical tools to assess how effectively the mathematical model represents the biological phenomenon provides an innovative way to improve mathematical modeling of highly stochastic biological processes.
 - We are hoping that making mathematical models more realistic becomes a trend in mathematics.
