This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- A dynamical model is developed to study HIV-like particle (HLP) assembly *in vitro*.
- The existence and uniqueness of the positive equilibrium solution for this model with 79 nonlinear equations are proved.
- Geometry parameters values are computed with few calculations by six-fold symmetry.
- Three important parameters influence the concentration variation rates of all intermediates before equilibrium and at equilibrium.
- The relationship between the initial concentration of building blocks and concentrations of all intermediates is analyzed.
- Bounds of concentrations of free hexamers and HLP are estimated.
