This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- Non-hydrostatic, baroclinic, implicit wetting and drying for multi-scale simulation.
- Substantially improves and controls matrix conditioning in high aspect ratio regions.
- Introduces physically-based and consistent stabilisation.
- 3D fully-unstructured approach improves accuracy where vertical inertia is important.
- Enables multi-scale inundation applications, for urban flooding and tsunami scenarios.
