This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A leaky unconfined aquifer model for CHT with unsaturated flow is build.
- The effects of model parameters on wellbore flowrate Q are investigated.
- The sensitivity of Q to the change in each of model parameters is also analyzed.
- The equivalence of normalized drawdown of present and CRT solutions is studied.
- The comparison for the present solution with a numerical model has been made.
- The present solution is used to analyze drawdown data and estimate aquifer parameters.
