Effects of trees on mean wind, turbulence and momentum exchange within and above a real urban environment

M.G. Giometto, A. Christen, P.E. Egli, M.F. Schmid, R.T. Tooke, N.C. Coops, M.B. Parlange

PII: S0309-1708(17)30648-6
DOI: [10.1016/j.advwatres.2017.06.018](https://doi.org/10.1016/j.advwatres.2017.06.018)
Reference: ADWR 2878

To appear in: *Advances in Water Resources*

Received date: 22 June 2016
Revised date: 14 June 2017
Accepted date: 22 June 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- LES and tower measurements are used to quantify effect of urban trees on flow
- Roughness length and displacement height increase with increasing foliage density
- The ratio of turbulent to mean kinetic energy increases with increasing foliage
- Dense trees reduce downward turbulent transport of high-momentum fluid.
