This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Patterns of cholera socio-environmental risk factors were identified in Gonaives City, Haiti.
- Coastal flood plains are high-risk associated with easy access to a contaminated brackish water table.
- Hillside areas are high-risk associated with poverty, poor water availability and open defecation.
- Development of water supply networks and safe sanitation practices must be neighbourhood-specific.
