This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- We estimated the disease burden of gastrointestinal infections due to exposure to wastewater in Hanoi.
- We employed a quantitative microbial risk assessment (QMRA) methodology
- The burden of gastrointestinal infections in specific population groups is above WHO reference levels.
- There is a need for control measures to target rotavirus and pathogenic *Escherichia coli* infection.
- Strengths and limitations of the QMRA methodology are discussed.
