This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The framework allows to quantify and map the benefits and limitations of Green Infrastructure for urban flood mitigation.
- In the LSC catchment, Green Infrastructure substantially reduces urban flood hazards from short duration storms.
- Green Infrastructure efficacy should be tested in terms of storm probability and duration.
