Evaluating the Role of Groundwater on Circulation and Thermal Structure in a Deep Inland Lake

Ammar Safaie, Elena Litchman, Mantha S. Phanikumar

PII: S0309-1708(17)30008-8
DOI: [10.1016/j.advwatres.2017.08.002](https://doi.org/10.1016/j.advwatres.2017.08.002)
Reference: ADWR 2913

To appear in: *Advances in Water Resources*

Received date: 4 January 2017
Revised date: 6 June 2017
Accepted date: 3 August 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Hypolimnetic temperatures are controlled by groundwater
- Summer lake temperatures increase by 6.5°C or more if groundwater inflow is absent
- Accurate hydrodynamic simulations possible using WRF model forcings
