## Abstract

Marine protected areas (MPAs) are considered one of the main tools in both fisheries and conservation management to protect threatened species and their habitats around the globe. However, MPAs are underrepresented in marine environments compared to terrestrial environments. Within this context, we studied the Atlantic non-breeding distribution of the southern population of Balearic shearwaters (*Puffinus mauretanicus*) breeding in Ibiza during the 2011-2012 period based on global location sensing (GLS) devices.
