A STUDY OF CONDITIONAL SPREADING SEQUENCES

SPIROS A. ARGYROS, PAVLOS MOTAKIS, AND BÜNYAMIN SARI

ABSTRACT. It is shown that every conditional spreading sequence can be decomposed into two well behaved parts, one being unconditional and the other being convex block homogeneous, i.e. equivalent to its convex block sequences. This decomposition is then used to prove several results concerning the structure of spaces with conditional spreading bases as well as results in the theory of conditional spreading models. Among other things, it is shown that the space $C(\omega^\omega)$ is universal for all spreading models, i.e., it admits all spreading sequences, both conditional and unconditional, as spreading models. Moreover, every conditional spreading sequence is generated as a spreading model by a sequence in a space that is quasi-reflexive of order one.

CONTENTS

1. Introduction	2
2. Preliminaries	7
3. Convex block homogeneous bases	9
4. A characterization: decomposing conditional spreading norms	14
5. Block sequences of conditional spreading bases	16
6. Characterizing strongly summing conditional spreading sequences	19
7. Non-trivial weak Cauchy sequences in spaces with conditional spreading bases.	21
8. Complemented subspaces of spaces with conditional spreading bases	26
9. The Baire-1 functions of a space with a spreading basis	33
10. Spreading models of non-reflexive spaces	34
11. Universality of $C(\omega^\omega)$ for all spreading models	37
12. Spreading models of quasi-reflexive spaces	42
13. The diversity of convex block homogeneous bases	50
