Fractional Laplacians

Direct method of moving spheres

Radial symmetry

Non-existence of solutions

### ABSTRACT

In this paper, we introduce a direct method of moving spheres for the fractional Laplacian  $(-\Delta)^{\alpha/2}$  with  $0 < \alpha < 2$ , in which a key ingredient is the narrow region maximum principle. As immediate applications, we classify non-negative solutions for semilinear equations involving the fractional Laplacian in  $\mathbb{R}^n$ ; we prove a non-existence result for the prescribing  $Q_\alpha$  curvature equation on  $\mathbb{S}^n$ ; then by combining the direct method of moving planes and moving spheres, we establish a Liouville type theorem on a half Euclidean space. We expect to see more applications of this method to many other nonlinear equations involving non-local operators.

### 1. Introduction

Recently, the fractional Laplacian has seen more and more applications in Physics, Chemistry, Biology, Probability, and Finance; and it has drawn more and more attention from the mathematical community. This fractional Laplacian is a pseudo-differential operator defined by

$$\begin{aligned}
 (-\Delta)^{\alpha/2}u(x) &\equiv C_{n,\alpha} \text{P. V.} \int_{\mathbb{R}^n} \frac{u(x) - u(y)}{|x - y|^{n+\alpha}} dy \\
 &\equiv C_{n,\alpha} \lim_{\epsilon \rightarrow 0} \int_{\mathbb{R}^n \setminus B_\epsilon(x)} \frac{u(x) - u(y)}{|x - y|^{n+\alpha}} dy,
 \end{aligned}
 \tag{1.1}$$

for any real number  $0 < \alpha < 2$ .

Let

$$L_\alpha \equiv \left\{ u : \mathbb{R}^n \rightarrow \mathbb{R}^1 \mid \int_{\mathbb{R}^n} \frac{|u(x)|}{1 + |x|^{n+\alpha}} dx < \infty \right\}.
 \tag{1.2}$$

Then the operator  $(-\Delta)^{\alpha/2}$  is well defined on the functions  $u$  in  $L_\alpha \cap C_{loc}^{1,1}$ . One can see from the definition (1.1) that it is nonlocal: Even  $u$  is identically zero in a neighborhood of a point  $x$ ,  $(-\Delta)^{\alpha/2}u(x)$  still may not vanish. Hence, traditional methods on local differential operators, such as on Laplacian  $-\Delta$  may not work on this nonlocal operator. To circumvent this difficulty, Caffarelli and Silvestre [2] introduced the *extension method* that reduced this nonlocal problem into a local one in higher dimensions. For a function  $u : \mathbb{R}^n \rightarrow \mathbb{R}$ , let  $U : \mathbb{R}^n \times [0, \infty) \rightarrow \mathbb{R}$  be its extension satisfying

$$\begin{cases}
 \text{div}(y^{1-\alpha} \nabla U) = 0, & (x, y) \in \mathbb{R}^n \times [0, \infty), \\
 U(x, 0) = u(x), & x \in \mathbb{R}^n.
 \end{cases}$$

Then

$$(-\Delta)^{\alpha/2}u(x) = -C_{n,\alpha} \lim_{y \rightarrow 0^+} y^{1-\alpha} \frac{\partial U}{\partial y}, \quad x \in \mathbb{R}^n.$$
