Nonnegative and eventually positive matrices

F. Shakeri ^{*} and R. Alizadeh [†]

Abstract

We characterize those eventually positive matrices A such that the sum of A and every nonnegative matrix remains eventually positive. For $n \geq 3$, we show that for every eventually positive matrix $A \in M_n(\mathbb{R})$, there exists an eventually positive matrix B such that $A + B$ is not eventually positive.

Keywords: Nonnegative matrices, Perron-Frobenius property, eventually positive matrices.

AMS subject classification : 15B48

1 Introduction

Eventually positive (nonnegative) matrices are real matrices whose powers become and remain entrywise positive (nonnegative). These types of matrices have applications in control theory [16] and have been the subject of study in several papers, see [1-5,7,8,9,17,18,19] and the references therein. The class of eventually nonnegative matrices was introduced by Friedland [6], where he characterized the spectrum of such matrices. In [8], authors addressed the Jordan form of irreducible eventually nonnegative matrices. Kirkland et al. [12] introduced and studied the class of algebraically positive matrices, which subsumes the class of eventually positive matrices.
