New evidence of highly-complex geological heritage in Iran: Miocene sections in the Zagros Fold-Thrust Belt

Tahereh Habibi , Nadezhda V. Golubova , Dmitry A. Ruban

PII: S2214-2428(17)30011-6
DOI: [10.1016/j.grj.2017.04.001](https://doi.org/10.1016/j.grj.2017.04.001)
Reference: GRJ 69

To appear in: *GeoResJ*

Received date: 30 January 2017
Revised date: 28 February 2017
Accepted date: 2 April 2017

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The calcareous Mishan Formation (Neogene) is widespread in the Zagros Basin
- The Mishan and Esmail-Abad sections are potential global geosites
- Rich Miocene fossil assemblages occur in these global geosites
- Sections are valuable for researchers, educators, and geotourists
- A geopark might be established in Zagros
