This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Residual clay deposits on basement rocks:**The impact of climate and the geological setting on supergene argillitization in the Bohemian Massif (Central Europe) and across the globe.**Harald G. Dill^{1*)}

Gottfried Wilhelm Leibniz University, Welfengarten 1

D-30167 Hannover, Germany

Table of contents**Abstract****1. Introduction - Overview, strategy and aims**

1.1 An overview of argillitization on crystalline bedrocks

1.2 The scope of the review of argillitization on crystalline bedrocks

*1.2.1 Establishing the basics of in-situ argillitization on a regional scale**1.2.2 Comparing and testing the basics on a global scale**1.2.3 The final goal of this full-scale review***2. Field and laboratory methods - Analysis of argillitization on crystalline bedrocks****3. Geological setting - The reference site of argillitization**

3.1 The basement and its crystalline rocks

3.2 The foreland basin and its sediments

4. Results - Collecting data of residual argillitization on a regional scale

4.1 Host rock geology vs. size and shape of argillitization

*4.1.1 Ultrabasic and basic igneous rocks**4.1.2 Intermediate felsic igneous rocks**4.1.3 Metapsammo-pelitic rocks**4.1.4 Metacarbonate rocks*
