Keywords: Bisphenol-A Rodents Developmental exposures Median and linear spline and metaregression

ABSTRACT

Exposures to bisphenol-A, a weak estrogenic chemical, largely used for the production of plastic containers, can affect the rodent behaviour. Thus, we examined the relationships between bisphenol-A and the anxiety-like behaviour, spatial skills, and aggressiveness, in 12 toxicity studies of rodent offspring from females orally exposed to bisphenol-A, while pregnant and/or lactating, by median and linear splines analyses. Subsequently, the meta-regression analysis was applied to quantify the behavioural changes. U-shaped, inverted U-shaped and J-shaped dose-response curves were found to describe the relationships between bisphenol-A with the behavioural outcomes. The occurrence of anxiogenic-like effects and spatial skill changes displayed U-shaped and inverted U-shaped curves, respectively, providing examples of effects that are observed at low-doses. Conversely, a J-dose-response relationship was observed for aggressiveness. When the proportion of rodents expressing certain traits or the time that they employed to manifest an attitude was analysed, the meta-regression indicated that a borderline significant increment of anxiogenic-like effects was present at low-doses regardless of sexes (β) = -0.8%, 95% C.I. -1.7/0.1, P=0.076, at <120 µg bisphenol-A. Whereas, only bisphenol-A-males exhibited a significant inhibition of spatial skills (β) = 0.7%, 95% C.I. 0.2/1.2, P = 0.004, at \leq 100 µg/day. A significant increment of aggressiveness was observed in both the sexes (β) = 67.9, C.I. 3.4, 172.5, P = 0.038, at >4.0 µg. Then, bisphenol-A treatments significantly abrogated spatial learning and ability in males (P < 0.001 vs. females). Overall, our study showed that developmental exposures to low-doses of bisphenol-A, e.g. <120 µg/day, were associated to behavioural aberrations in offspring.

1. Introduction

It is noteworthy that the reproductive endocrine system is sexually dimorphic, accommodating common sex differences in gametogenesis, steroidgenesis, and the sexual behaviour. The control of these processes takes place in the hypothalamic-limbic neural network, that is governed in a sex-specific manner by the sexual hormones, including estradiol, progesterone, testosterone and dihydrotestosterone, during critical periods of development, such as late in the fetal development and soon after birth in mammals. This complex system develops in a sexually dimorphic manner and results in the typical reproductive physiology and the sexual behaviour in adulthood. In males, testosterone is required to establish and maintain neural circuits that later control the maletypical behaviour (Lenz and McCarthy, 2010). To induce masculinization is also necessary the synthesis, in the developing brain, of aromatase enzyme for the conversion of testosterone to estradiol and its interaction upon neural estrogen receptors, ER α and ER β , (Cornil et al., 2006; Juntti et al., 2010). Conversely, female fetal brain has decreased exposures to testosterone and estradiol (Lenz and McCarthy, 2010). In females, brain is even protected by the circulating α -fetoprotein from masculinization and defeminisation by estrogens (Bakker et al., 2006).

Endocrine-disrupting chemicals are synthetic and/or naturally occurring compounds released in the environment, that can interfere with the endocrine system (Diamanti-Kandarakis et al., 2009). Certain endocrine disruptors are compounds that mimic or inhibit the actions of endogenous hormones, and cause reproductive dysfunctions and behavioural aberrations (Diamanti-Kandarakis et al., 2009). Among the endocrine-disrupting chemicals, there is the carbon-based synthetic compound bisphenol-A (BPA; CAS# 80-05-7) or 4,4'-(propane-2,2-diyl) diphenol [CH₃)₂C(C₆H₄OH)₂], a weak estrogenic chemical with mixed estrogen agonist and antagonist properties (Kundakovic and Champagne, 2011), largely used in the production of plastic food containers, receipts, and dental sealants (Vandenberg et al., 2007). This endocrine disruptor
