This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Longer Duration of Statin Therapy is Associated with Decreased Carotid Plaque Vascularity by Magnetic Resonance Imaging

FUNDING SOURCES

This AIM-HIGH sub-study was supported by National Heart, Lung, and Blood Institute (NHLBI) grants R01-HL089504 (to Dr. O'Brien) and R01-HL088214 (to Dr. Zhao). No commercial entity provided any direct support for this sub-study, nor did any commercial entity have any role in sub-study oversight, design, or data analysis and interpretation.

The parent trial, AIM-HIGH, was supported by NHLBI grants U01-HL-081616 and U01-HL-081649, as well as by an unrestricted grant from Abbott Laboratories (now AbbVie), Chicago, IL, as well as drug donations from Abbott Laboratories and from Merck.

CONFLICT OF INTEREST

Outside of the present study, Dr. Yuan reports grants from the NIH and Philips Medical. He also serves as a Member of Radiology Advisory Network, Philips. Mr. Hippe reports grants from GE Healthcare. No other authors have any other potential conflicts of interest to disclose.
