This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Intracortical Microstimulation Parameters Dictate the Amplitude and Latency of Evoked Responses

The methods of this research study will be presented at the 37th Annual International Conference of the IEEE Engineering in Medicine and Biology Society in Milan, Italy (25-29 August 2015). Corresponding author Tel.: +1 (438) 993-5765; email address: meghan.watson@polymtl.ca

Highlights

- We examined the influence of stimulation parameters on the responses they evoke.
- Response amplitude and latency were strictly controlled by stimulation parameters.
- Many parameter interactions and functional limits were identified.
- Effective parameter combinations were identified for restrictive paradigms.
- A new approach to stimulation signal design was proposed.
