Abstract: Restless legs syndrome (RLS), is a relatively common, complex, and treatable pediatric neurological condition; consensus diagnostic criteria for children were updated in 2013 and specific treatment data are rising. Sleep onset, sleep maintenance and behavioral issues are the most frequent complaints. The diagnosis is based on clinical history, but in non verbal children behavioral observation, directly or through video recording, is fundamental. We describe the case of a 14 months old girl with severe chronic insomnia and a peculiar movement pattern of legs kicking and rubbing with an apparent discomfort and pain at home video recording.
