Highlights

- The dreams of people with Parkinson's disease (PD) and with/without rapid eye movement sleep behavior disorder (RBD) were collected in a sleep laboratory.
- Analysis for action-filledness, vividness, emotionality and threats was conducted.
- There were no significant between-group differences in the content of dreams.
- The people with PD and RBD had a tendency to have more-intense actions in their dreams.
- The people with PD and RBD had more negative dreams compared to positive dreams.
