

## Accepted Manuscript

Title: Development of a fluorescent *in situ* hybridization (FISH) technique for visualizing CGMMV in plant tissues

Author: D. Shargil H. Zemach E. Belausov O. Lachman R. Kamenetsky A. Dombrovsky

PII: S0166-0934(15)00257-8  
DOI: <http://dx.doi.org/doi:10.1016/j.jviromet.2015.07.014>  
Reference: VIRMET 12845

To appear in: *Journal of Virological Methods*

Received date: 22-5-2015  
Revised date: 20-7-2015  
Accepted date: 26-7-2015

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- Cucumber green mottle mosaic virus (CGMMV) is a major pathogen of cucurbit crops.
- A specific FISH was developed to differentiate between healthy and infected tissues.
- The FISH method was proven to be simple reliable.
- This method has meaningful epidemiological implications for CGMMV management.
