This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- Current source density mapping provides a finer-grained and more direct proxy for neural firing than the voltage density analyses currently ubiquitous in the field of neural electrophysiology.
- The total sink values calculated by the current source density map showed a positive relationship over several cases with the more conventional analysis of whole-tissue activation pre- and post- stimulation, suggesting their root in a common phenomenology.
- Our current source density analysis method was sensitive enough to uncover not only regional but also inter-individual differences in network response to TBS, even while demonstrating commonalities among the multiple cases to which it was applied.
