Alluvial Response to the Paleocene-Eocene Thermal Maximum Climatic Event, Polecat Bench, Wyoming (U.S.A.)

Mary J. Kraus, Daniel T. Woody, Jon J. Smith, Vanja Dukic

PII: S0031-0182(15)00318-1
DOI: doi: [10.1016/j.palaeo.2015.06.021](https://doi.org/10.1016/j.palaeo.2015.06.021)
Reference: PALAEO 7322

To appear in: *Palaeogeography, Palaeoclimatology, Palaeoecology*

Received date: 11 November 2014
Revised date: 7 May 2015
Accepted date: 15 June 2015

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Alluvial Response to the Paleocene-Eocene Thermal Maximum Climatic Event, Polecat Bench, Wyoming (U.S.A.)

Highlights:

- Changes in alluvial architecture are linked to PETM climate change
- Complexity and spacing of paleosols correspond to changes in accretion rates
- Slower rates of accretion correspond to warmer and drier conditions
- More rapid rates of accretion correspond to wetter climates
- Climate changes in the basin and catchment areas were congruent
