This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

1. A simple method for assessment of functional structure of mangrove forest
2. There was a significant correlation between the density of young plants and number of crab holes or tree density or seedling density or complex index.
3. This work provided a new method of assessing the eco-functions of mangrove forest
