This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

DISINFECTION OF WATER BY ADSORPTION COMBINED WITH ELECTROCHEMICAL TREATMENT

HIGHLIGHTS:

- Adsorption using a graphite flake adsorbent led to 6.5-log₁₀ reduction in *E. coli*
- Adsorption with electrochemical treatment achieved >8.5 log₁₀ reduction in *E. coli*
- Electrochemical disinfection was achieved in a chloride free environment
- The energy consumption required to achieve >8.5-log₁₀ disinfection was 2 - 7 kWh m⁻³
- The adsorbent was effectively regenerated by electrochemical treatment enabling reuse
