A generic model for a single strain mosquito-transmitted disease with memory on the host and the vector

Tridip Sardar, Sourav Rana, Sabyasachi Bhattacharya,
Kamel Al-Khaled, Joydev Chattopadhyay

PII: S0025-5564(15)00017-6
DOI: [10.1016/j.mbs.2015.01.009](https://doi.org/10.1016/j.mbs.2015.01.009)
Reference: MBS 7584

To appear in: *Mathematical Biosciences*

Received date: 10 February 2014
Revised date: 30 December 2014
Accepted date: 5 January 2015

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Fractional differential equation is used to study memory in host & vector
- Models are fitted to published monthly dengue incidence data from Venezuela
- Reproduction numbers and their upper bounds are analytically derived
- Model selection criterion is used to derive the best model among proposed models
- To control epidemics, memory of the host and the vector play a crucial role
