This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- This study proposes a new, entropy-based approach to define homogeneous regions
- The information transferred index (ITI) measures the information similarity of sites
- ITI defines bigger and higher homogeneous regions than classical methods
- ITI pools stations on the base of the information that they provide as an ensemble
