This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Sequential alginate grafting and sulfonation significantly improve the performance of alginate-grafted Sepharose FF for protein chromatography

Highlights

- Sequential alginate grafting and sulfonation of Sepharose enhanced charge density.
- Protein uptake rate showed an increase and then decrease trend with ionic capacity.
- High-charge-density resin showed high salt-tolerance in protein adsorption.
