Title: Detailed Investigations into the Akabori-Momotani reaction for the Synthesis of Amphetamine Type Stimulants: Part 2

Author: David Doughty Emma Kent Ben Painter Paul E. Pigou Martin R. Johnston

PII: S0379-0738(18)30037-9
DOI: <https://doi.org/doi:10.1016/j.forsciint.2018.01.023>
Reference: FSI 9151

To appear in: *FSI*

Received date: 6-9-2017
Revised date: 22-1-2018
Accepted date: 27-1-2018

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Akabori 2 highlights

- Substituted benzaldehydes convert into pseudoephedrine
- Electronic influence of the substituent on reaction outcomes were minor
- Molecular modelling provides insight into substituents lack of influence
- Sub-optimal reaction conditions with *p*-methoxy benzaldehyde produce new by-products
- Stereochemical purity of products rationalised by molecular modelling
