This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- The accuracy of dental PMCT is comparable or similar to that of conventional PM dental x-rays when correctly identifying disaster victims
- There is a potential for dental PMCT to replace PM dental x-rays in the DVI process of MFIs
- Further research is required to establish an international standard protocol for dental PMCT before it can be adopted as a new standard practice within the forensic setting
