This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- Propose a new methodology to deal with the front-end crude scheduling (FECS) problems with consideration of inherent upset minimization.
- Develop a novel MINLP model to determine the optimal FECS solution by minimizing the overall operating cost and instability.
- Address the flowrate fluctuations of feeding crude distillation units and the long-distance pipeline (LDPL) as the primary and secondary inherent upsets.
- Simultaneously consider the trans-mixing issue inside the LDPL and multiple types of crudes with multiple key properties.
