This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

Highlights

- A deep convolutional neural network model based fault diagnosis method is proposed for chemical processes.
- A deep convolutional neural network model is constructed and applied in the Tennessee Eastman process.
- An average fault diagnosis rate of 88.2% is achieved.
- The model tuning and the dynamic diagnostic performance are explored.
