This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

- We present a single-shooting algorithm for optimal control of UV flash processes.
- The algorithm uses an adjoint method to compute gradients.
- We formulate the optimal control problem as a bilevel optimization problem.
- A simultaneous approach for UV flash simulation is faster than a nested approach.
- We compare optimization software, linear algebra software, and compilers.
