11 **Abstract**

12 Usually, the thermophysical parameters of bananas available in the literature refer to the
13 flesh of the product. However, to prolong the shelf life avoiding injuries, product cooling
14 should be performed for bananas with peel (from room temperature to 13 °C). Thus, the
15 main objective of this article was to determine thermal properties of banana with peel
16 during its cooling. A solver was developed for the direct problem, using a two-
17 dimensional solution of the diffusion equation to describe heat transfer. For the inverse
18 problem, we used an experimental dataset of the temperature over time at the center of a
19 banana, and a ready-to-use optimizer software. Convective heat transfer coefficient and
20 thermal diffusivity were $h = (2.186 \pm 0.021) \times 10^{-6} \text{ m s}^{-1}$ and $\alpha = (1.45 \pm 0.06) \times 10^{-7} \text{ m}^2 \text{ s}^{-1}$, respectively. Heat transfer coefficient and thermal conductivity were $h_H = (4.93 \pm 0.05) \text{ W m}^{-2} \text{ K}^{-1}$ and $k = (0.328 \pm 0.014) \text{ W m}^{-1} \text{ K}^{-1}$, respectively. The chi-square and determination coefficient of the optimization process were 3.5484×10^{-2} and 0.999955, respectively.
