11 Highlights

12

- 13 • Acoustics strongly influence the sensory perception of puffed snacks' freshness.
- 14 • Multisensory integration of crispiness is modeled using instrumental data.
- 15 • The parameters impacting crispiness are evaluated to enable product optimization.
- 16 • The classification accuracy of crispiness is improved using spectral features.
- 17 • Machine learning is introduced for rapid quality control of food texture.

18

19 Abstract

20

21 The use of instrumental methods to support sensory panels in the routine quality control of
22 crispiness remains challenging. Texture analysis is often insufficient to accurately classify this
23 complex sensory attribute. Herein, 70 different food properties were combined via machine
24 learning algorithms to mimic multisensory integration. Force and sound were measured
25 during crushing of puffed snacks equilibrated at different humidity levels. Sensory panels
