

## Accepted Manuscript

A Multi-Phase Theory for the Detonation of Granular Explosives  
Containing an Arbitrary Number of Solid Components

M.W. Crochet, K.A. Gonthier

PII: S0301-9322(15)00176-7  
DOI: [10.1016/j.ijmultiphaseflow.2015.08.004](https://doi.org/10.1016/j.ijmultiphaseflow.2015.08.004)  
Reference: IJMF 2262

To appear in: *International Journal of Multiphase Flow*

Received date: 19 February 2015  
Revised date: 21 July 2015  
Accepted date: 2 August 2015

This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- A two-phase continuum model widely was formally extended to include multiple solid components.
- A Second Law analysis gives rise to additional reaction energy dissipation parameters.
- Energetic contributions to phase heating are evolved to determine dominant mechanisms.
- Metal oxidation energy may be coupled to the explosive reaction zone for enhanced detonation.
- A transition from metal endothermic heat absorption to oxidative heating is observed.
