This is a PDF file of an unedited manuscript that has been accepted for publication. As a service to our customers we are providing this early version of the manuscript. The manuscript will undergo copyediting, typesetting, and review of the resulting proof before it is published in its final form. Please note that during the production process errors may be discovered which could affect the content, and all legal disclaimers that apply to the journal pertain.

**Highlights**

- We model a Herschel-Bulkley fluid flow in varying bottom inclination channels
- The channels are widening and reducing the bottom inclination downstream
- We make experiments to verify the model, measuring the fluid rheometry and the front position time series
- Dam-break and constant inflow are reproduced, measuring also the free surface velocity and the current thickness
